

Programming Fundamentals

Abdul Haseeb

```
    "for object to mirror  
    mirror_mod.mirror_object  
  
    operation == "MIRROR_X":  
    mirror_mod.use_x = True  
    mirror_mod.use_y = False  
    mirror_mod.use_z = False  
  
    operation == "MIRROR_Y":  
    mirror_mod.use_x = False  
    mirror_mod.use_y = True  
    mirror_mod.use_z = False  
  
    operation == "MIRROR_Z":  
    mirror_mod.use_x = False  
    mirror_mod.use_y = False  
    mirror_mod.use_z = True
```

```
selection at the end -add  
_ob.select= 1  
mirror_ob.select=1  
context.scene.objects.active  
("Selected" + str(modifier))  
mirror_ob.select = 0  
bpy.context.selected_objects  
data.objects[one.name].sele
```

```
int("please select exactly one ob")
```

```
    print("Selected objects: ", selected)
```

```
    print("Selected modifier: ", modifier)
```

```
    print("Selected object: ", ob)
```

```
    print("Selected mirror object: ", mirror)
```

```
    print("Selected mirror modifier: ", mirror_mod)
```

```
    print("Selected mirror modifier type: ", mirror_mod.type)
```

```
    print("Selected mirror modifier operator: ", mirror_mod.type.Operator)
```

```
    print("X mirror to the selected object: ", mirror_mod.mirror_mirrored)
```

```
    print("X mirror X: ", mirror_mod.mirror_mirrored_X)
```

```
    print("X mirror Y: ", mirror_mod.mirror_mirrored_Y)
```

```
    print("X mirror Z: ", mirror_mod.mirror_mirrored_Z)
```

```
    print("Y mirror to the selected object: ", mirror_mod.mirror_mirrored)
```

```
    print("Y mirror X: ", mirror_mod.mirror_mirrored_X)
```

```
    print("Y mirror Y: ", mirror_mod.mirror_mirrored_Y)
```

```
    print("Y mirror Z: ", mirror_mod.mirror_mirrored_Z)
```

```
    print("Z mirror to the selected object: ", mirror_mod.mirror_mirrored)
```

```
    print("Z mirror X: ", mirror_mod.mirror_mirrored_X)
```

```
    print("Z mirror Y: ", mirror_mod.mirror_mirrored_Y)
```

```
    print("Z mirror Z: ", mirror_mod.mirror_mirrored_Z)
```

Course Objectives

- *The aim is not to make you the expert of computer programming but only the basics of computer programming.*
- *To familiarize students with the use of C++.*
- *To equip students with tools and techniques to implement a given problem programmatically*

Recommended Books

- *Problem Solving with C++ 10th edition by Walter Savitch- Pearson Prentice-Hall*
- *C++ Programming from Problem Analysis to Program Design, 7th Edition, By, DS Malik*
- *Programming in C++ by Dietel and Dietal*
- *Programming in C++ by Robert Laphore*
- *Lecture Handouts*

Grading Criteria

Mid Term = 30%

Final Exam = 40%

Sessional = 60%

Recommended Book

- *Problem Solving with C++ 10th edition by Walter Savitch- Pearson Prentice-Hall*
- *C++ Programming from Problem Analysis to Program Design, 7th Edition, By, DS Malik*
- *Programming in C++ by Dietel and Dietal*
- *Programming in C++ by Robert Laphore*
- *Lecture Handouts*

about Course Instructor

Abdul Haseeb Shaikh, MS(CS) with Specialization in Machine Learning and Deep Learning from Sukkur IBA University 2021.

Ex-Lecturer at Sukkur IBA University Kandhkot Campus

Ex-Subject Specialist at IBA Community College Khairpur

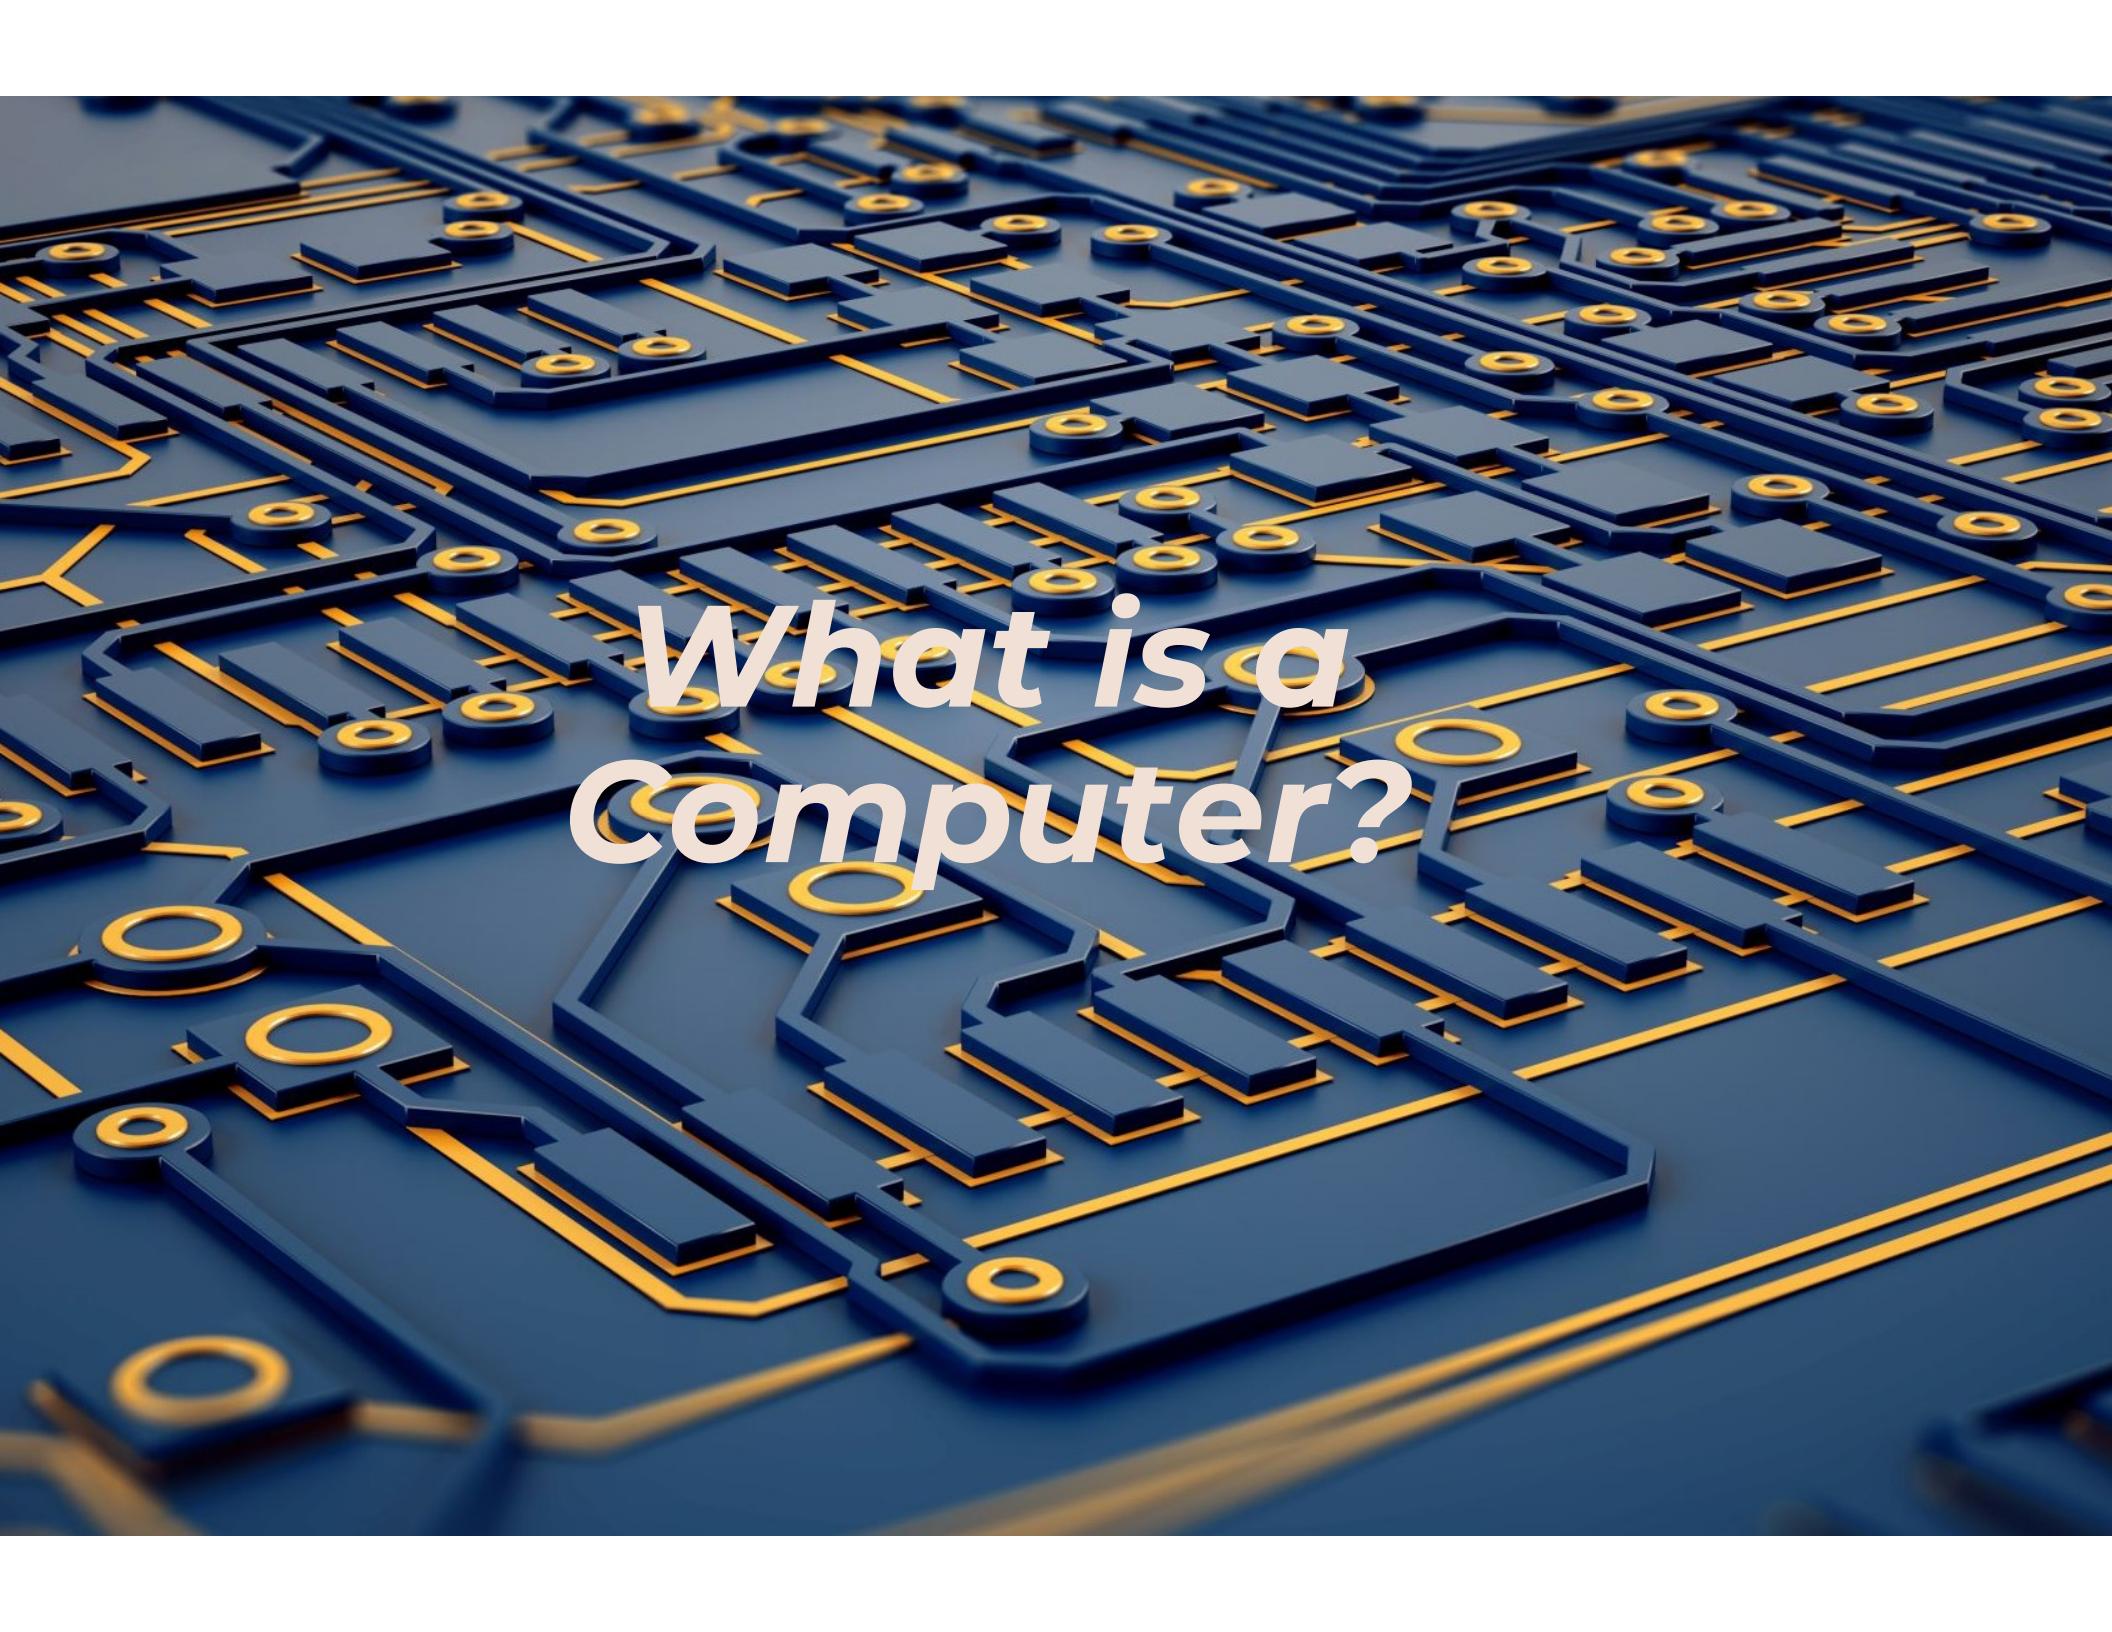

Research Interests: Cybersecurity, Machine Learning, Deep Learning, AI in Cybersecurity

Programming Languages:

C++, Java, Python

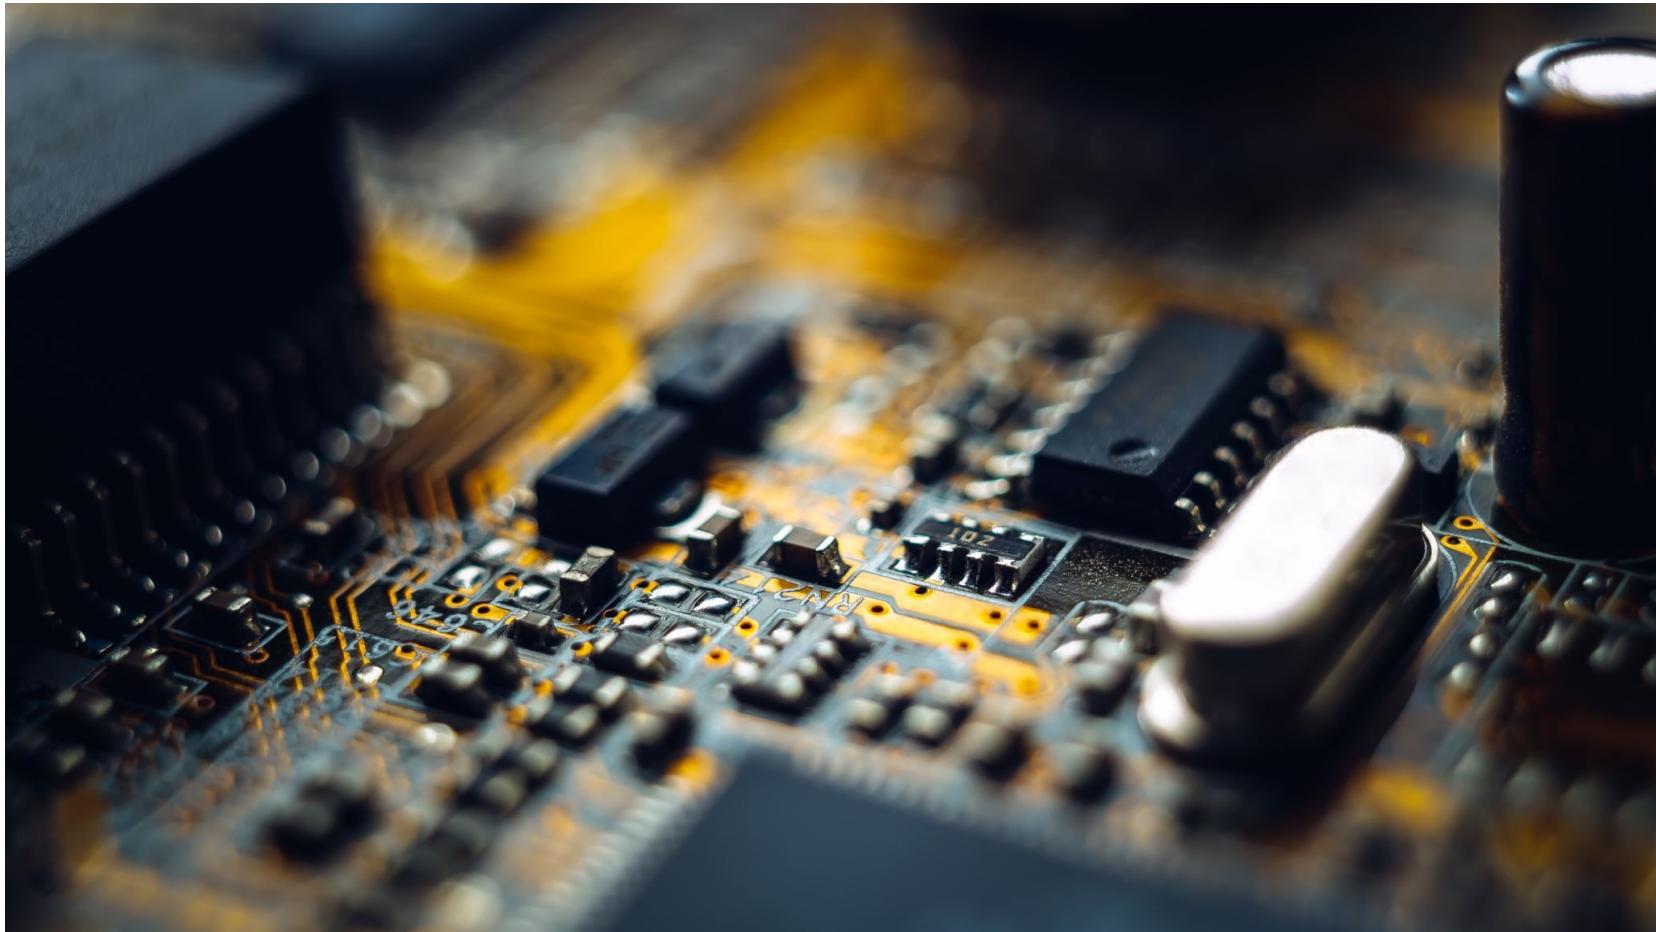

How to Reach me?

ahaseeb.faculty@aror.edu.pk

A blue and gold 3D rendering of a circuit board with a central text overlay. The circuit board features a complex network of blue rectangular components and gold-colored tracks and capacitors. The text "What is a Computer?" is centered in the middle of the board in a large, white, sans-serif font.

What is a
Computer?

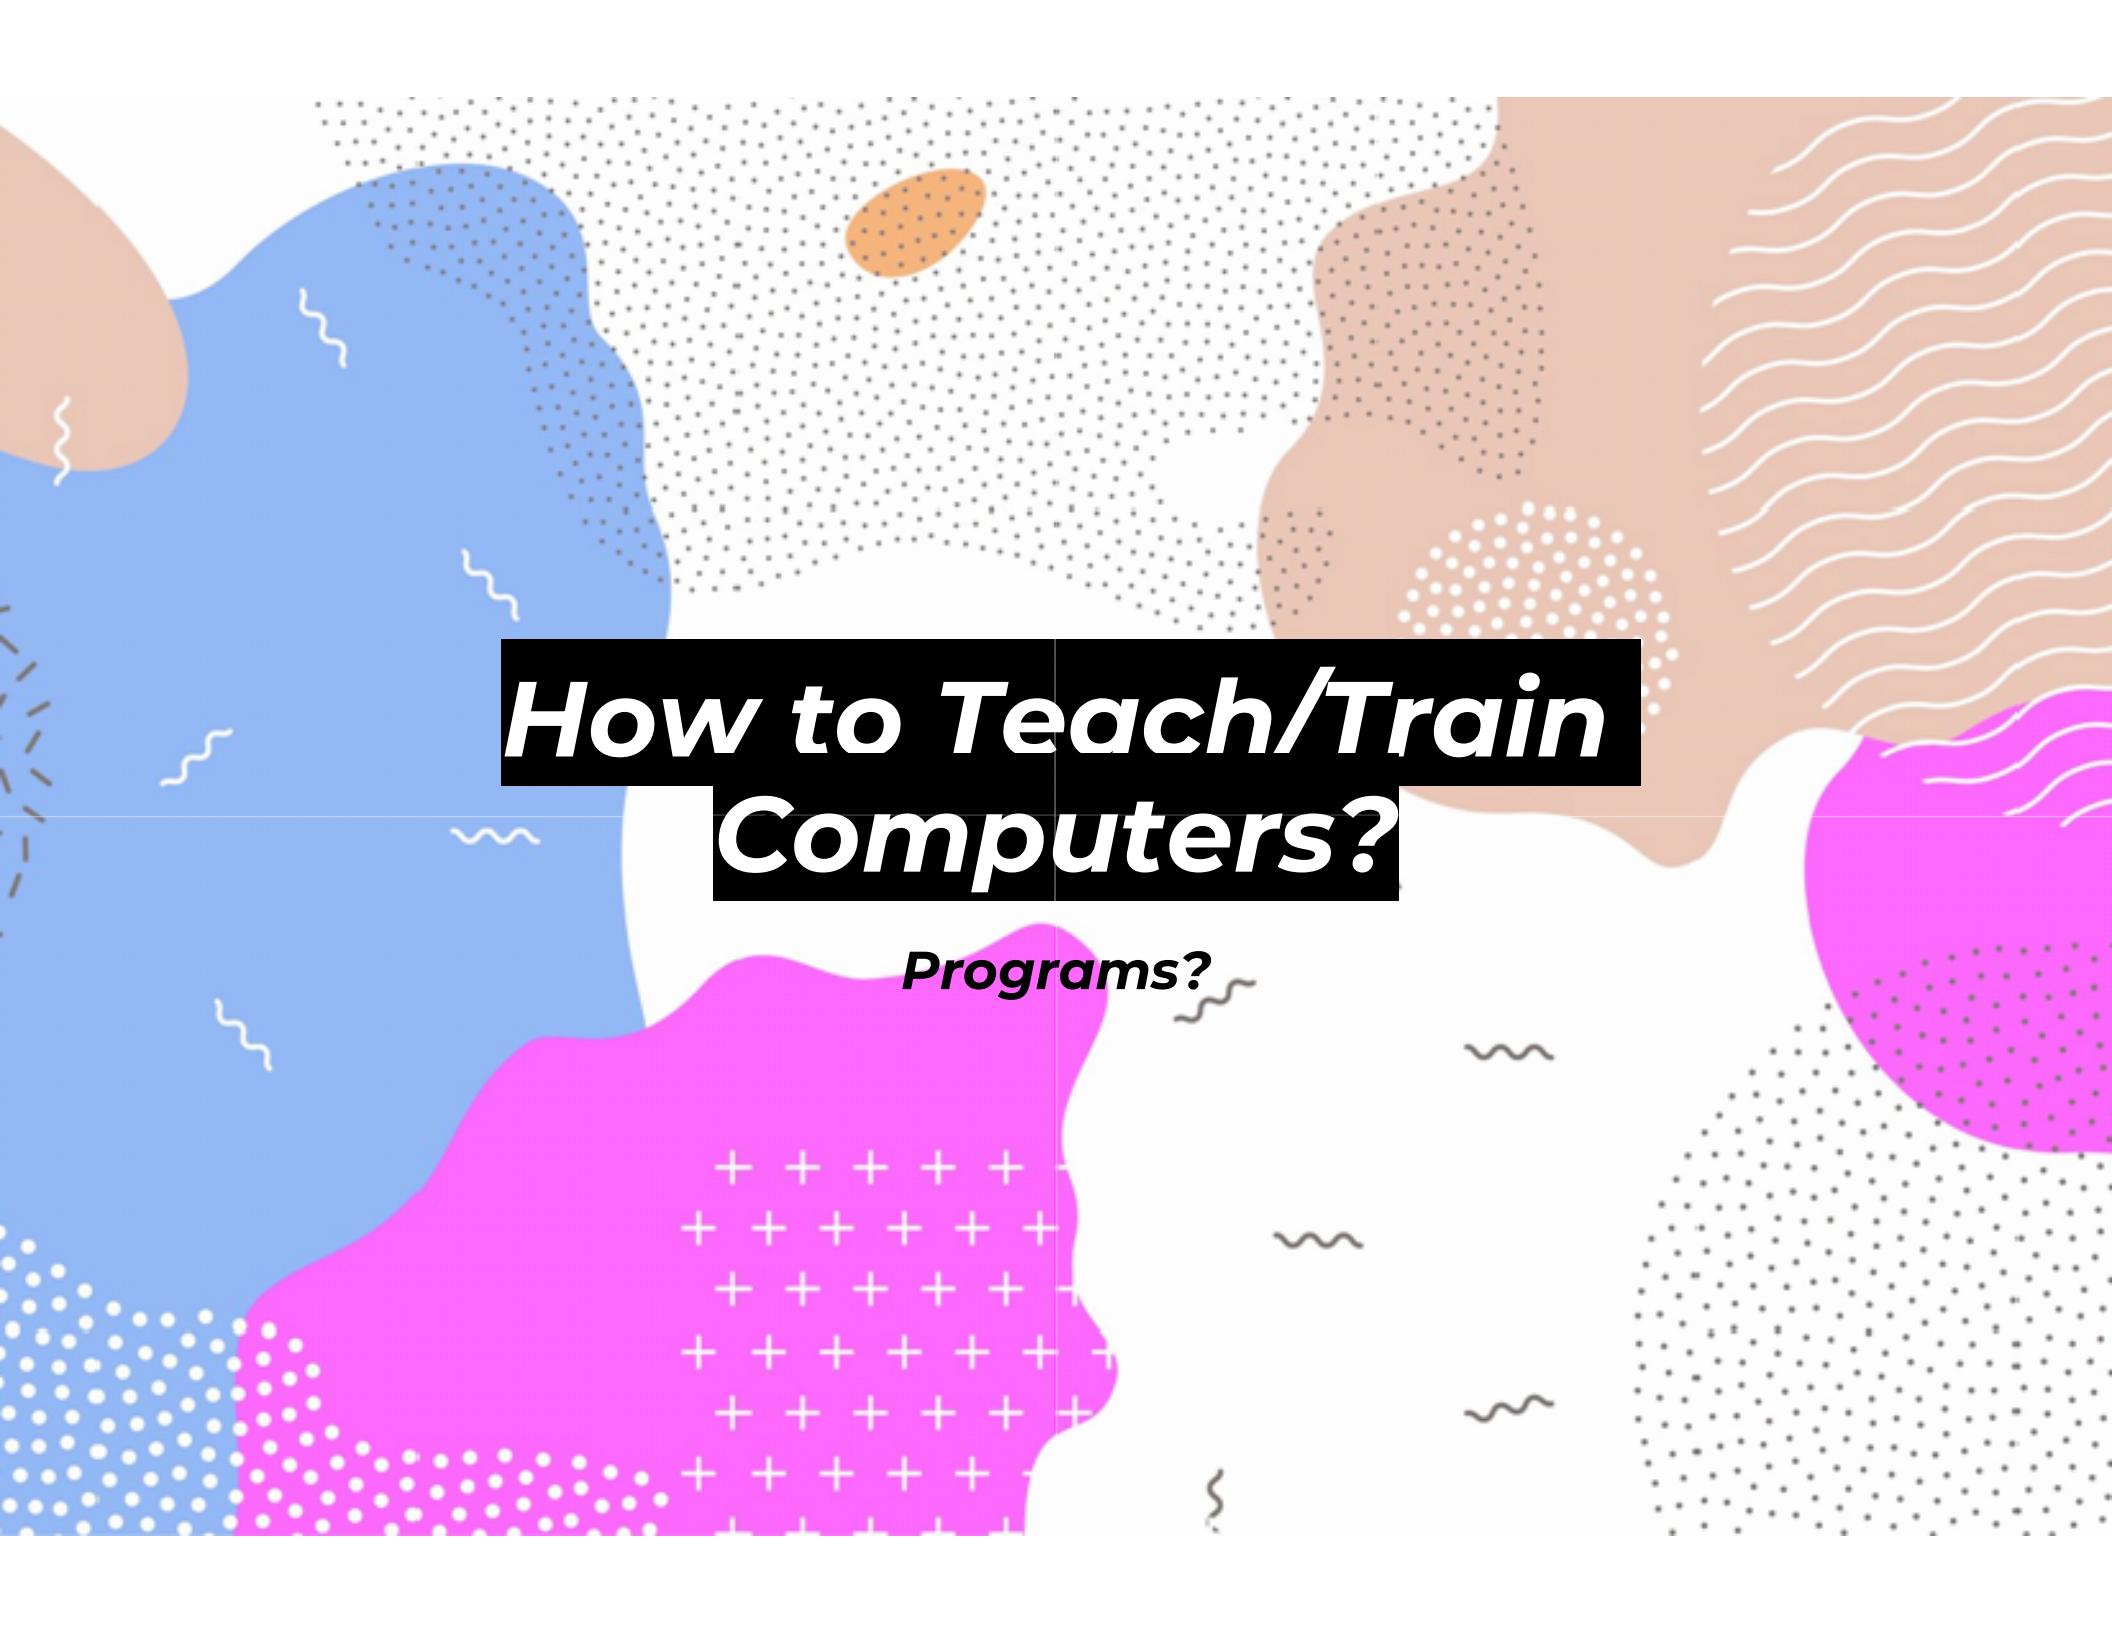

WHAT IS COMPUTER?

An Electronic device which can accept data as input, processes it and produces output

ARE COMPUTERS MORE INTELLIGENT THAN HUMANS?

Computers can outperform humans in some tasks like playing games etc, but they cant match the intelligence of a human

How to Teach/Train Computers?

Programs?

Definition of a Program

*List/Set of Instructions
which allows a computer
to perform specific task*

Programming

The process of Writing a program

```
    ' or object to mirror
mirror_mod.mirror_object
operation == "MIRROR_X":
mirror_mod.use_x = True
mirror_mod.use_y = False
mirror_mod.use_z = False
operation == "MIRROR_Y":
mirror_mod.use_x = False
mirror_mod.use_y = True
mirror_mod.use_z = False
operation == "MIRROR_Z":
mirror_mod.use_x = False
mirror_mod.use_y = False
mirror_mod.use_z = True

selection at the end -add
mirror_ob.select= 1
mirror_ob.select=0
context.scene.objects.active = mirror_ob
("Selected" + str(modifier))
mirror_ob.select = 0
bpy.context.selected_objects = []
data.objects[modifier].select = 1

int("please select exactly one object")
-- OPERATOR CLASSES ---

types.Operator:
  X mirror to the selected object.mirror_mirror_x"
  "mirror X"
```

Programming Languages

- ***What is a Language?***
 - ***Means of communication***
- ***Different Languages like C++, Java, Python, Julia, Ruby, Swift, Javascript, Fortan, Pascal, Basic etc***

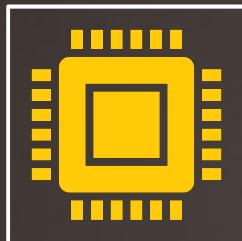

```
mirror_mod = modifier_obj
# Set mirror object to mirror
mirror_mod.mirror_object = None
if operation == "MIRROR_X":
    mirror_mod.use_x = True
    mirror_mod.use_y = False
    mirror_mod.use_z = False
elif operation == "MIRROR_Y":
    mirror_mod.use_x = False
    mirror_mod.use_y = True
    mirror_mod.use_z = False
else:
    mirror_mod.use_x = False
    mirror_mod.use_y = False
    mirror_mod.use_z = True

# Selection at the end - add
modifier_obj.select = 1
modifier.select = 1
context.scene.objects.active = eval("Selected" + str(modifier))
modifier.select = 0

print("please select exactly one object")
# OPERATOR CLASSES -----
# MIRROR OPERATOR
if types.Operator:
    # X mirror to the selected object.mirror_mirror_x
    # or X
    if context:
        if context.active_object is not None:
```

Why was programming developed?

Automation:

Past computers used to perform complex calculations

- Manual Adjustment for each calculation

Complex Problem Solving:

As computer technology advanced, there was a need to solve complex problems

Why learn Programming?

Foundation of CS:

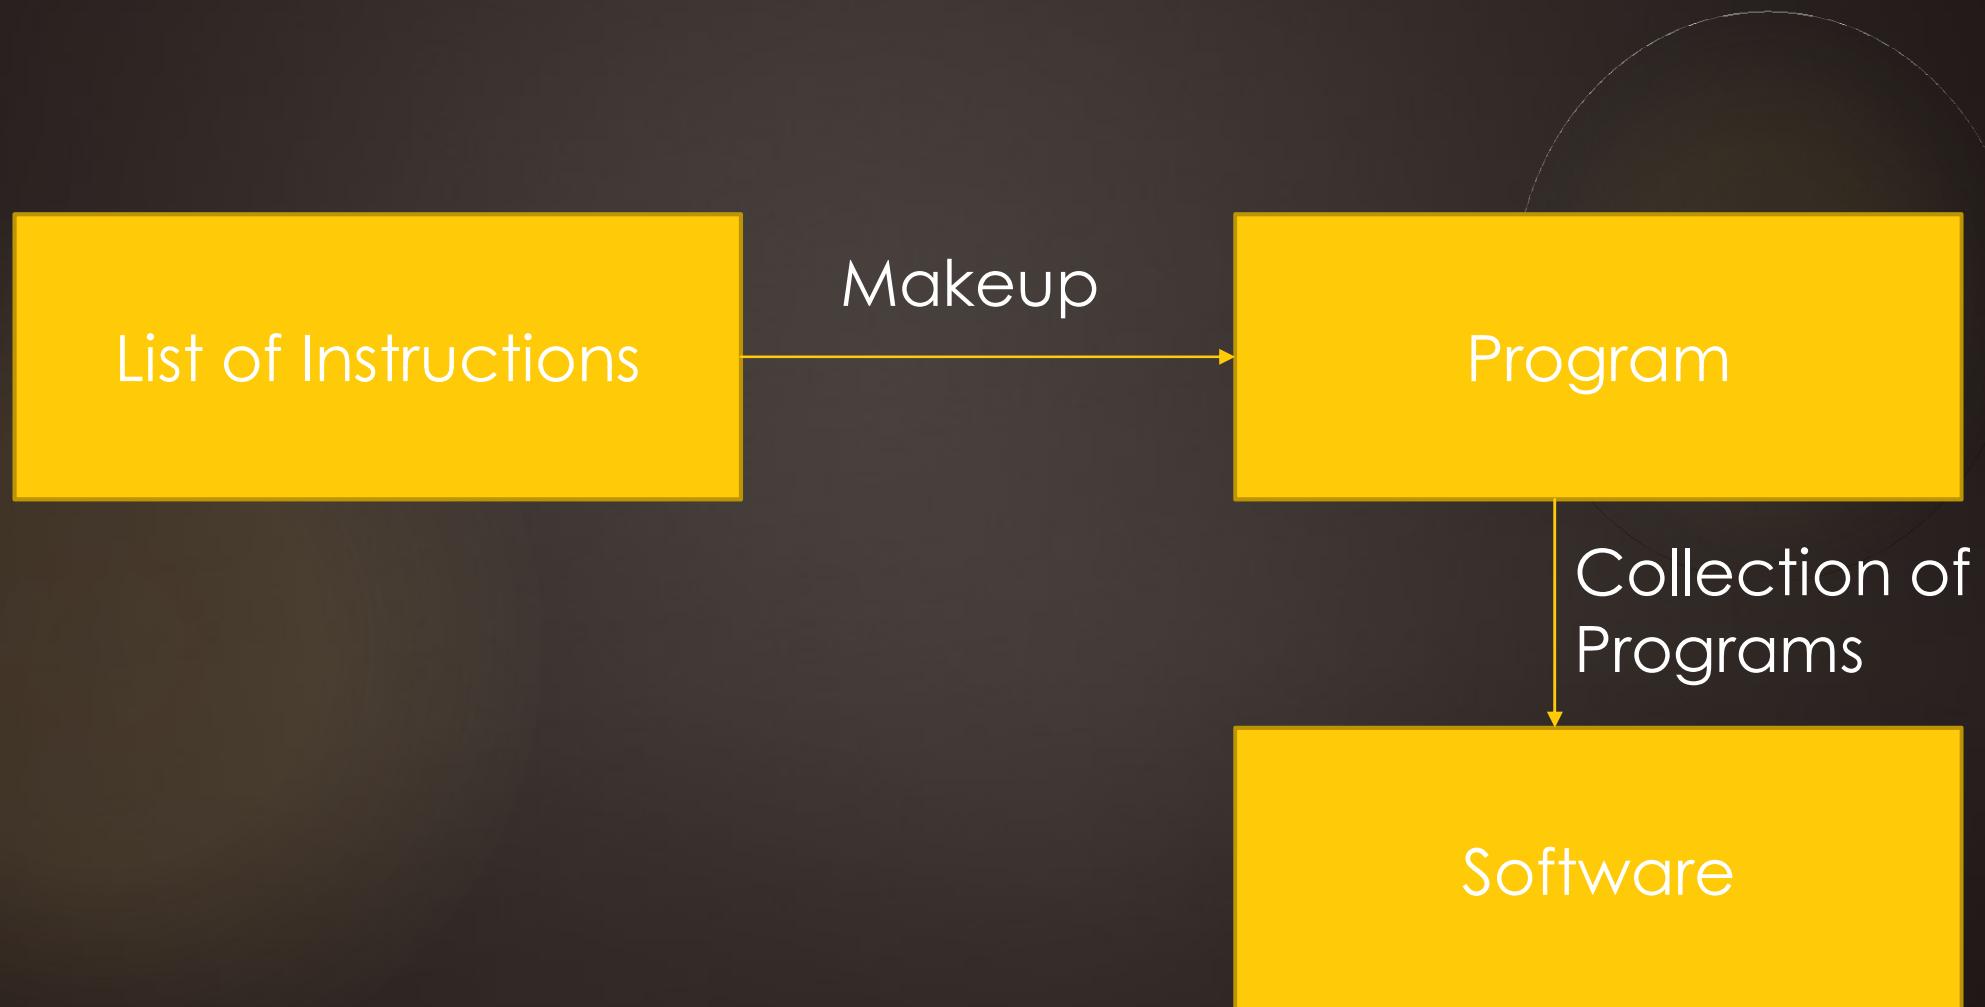

- ▶ For every advanced CS Subject, you will need programming at some point

Problem solving:

- ▶ Complex problems require creative solutions, provided with programming

What is Software?

Languages to write computer programs

Computer Programs
can be written in **low
level language or
high level language**

A person who write
computer programs
is called
programmer

Most programmers
use **high level
language** to write
programs

High Level languages

High Level Languages allow the programmers to just focus on the problem to be solved, and they don't need to worry about the knowledge of hardware.

High Level Languages are portable

Example of a code snippet written in high level language to add two numbers:

```
Sum := FirstNumber+  
      SecondNumber
```

High Level Languages

- ❑ C++, Delphi, Java, Python, Pascal, Visual Basic are the examples of High Level Language
- ❑ Once you learn concepts of programming, you can easily switch between the languages

Advantages of High Level languages

They use very easy statements so that programmer can easily write the programs

Read and Understand the program as it is closer to human language

Low Level Languages

- ▶ Low Level Languages are closer to the understanding of Computers
 - ▶ Machine Language
 - ▶ Assembly Language

Machine language Low level)

- ❑ Programmers don't write in machine code, as it is very difficult to understand and is very complicated.
- ❑ Code Snippet to add two numbers using Machine Language

		Hexadecimal	Binary
1	12	0001	00010010
4	13	0100	00010011
0	1A	0000	00011010

Figure 7.3

Assembly Language (Low Level)

- ▶ Use **Mnemonics** for writing code

LDA	First
ADD	Second
STO	Sum

Simple Quiz!

- ▶ Which type of language is Java
- ▶ How do programmers write code in Assembly Language

What do you think how
programming is going to transform
your life?

Concept of translators

- ▶ Programmers write code in high level
- ▶ Computers understand Machine code
- ▶ There is the need for translation High Level language to Machine Code

Compiler

- ▶ Translates a program written in high level language into machine code at once
- ▶ Compiled program can be reused without recompilation
- ▶ C++ uses compiler
 - ▶ GCC (GNU Compiler Collection)

Compiler

The high-level program statement

```
Sum := FirstNumber + SecondNumber
```

becomes the following machine code instructions when translated

0001	00010010
0100	00010011
0000	00011010

Interpreter

Interpreter reads one statement at a time from the program written in high level language, performs action, and does the same with the next statement.

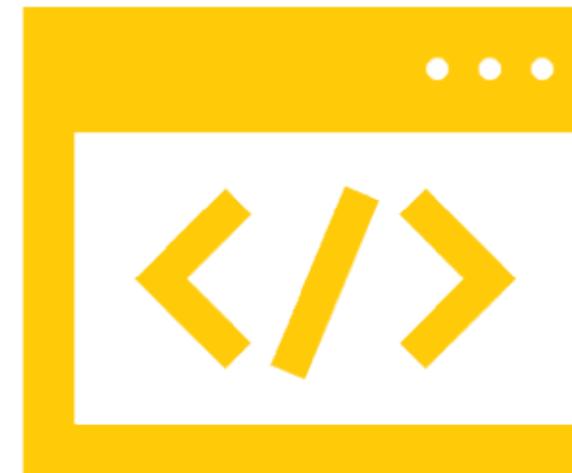

Python, perl, ruby use interpreter

Assembler

It translates program written in assembly language into machine code, so that it can be directly used by a computer to perform a required task.

It works like a compiler for assembly language.

Simple Quiz #02

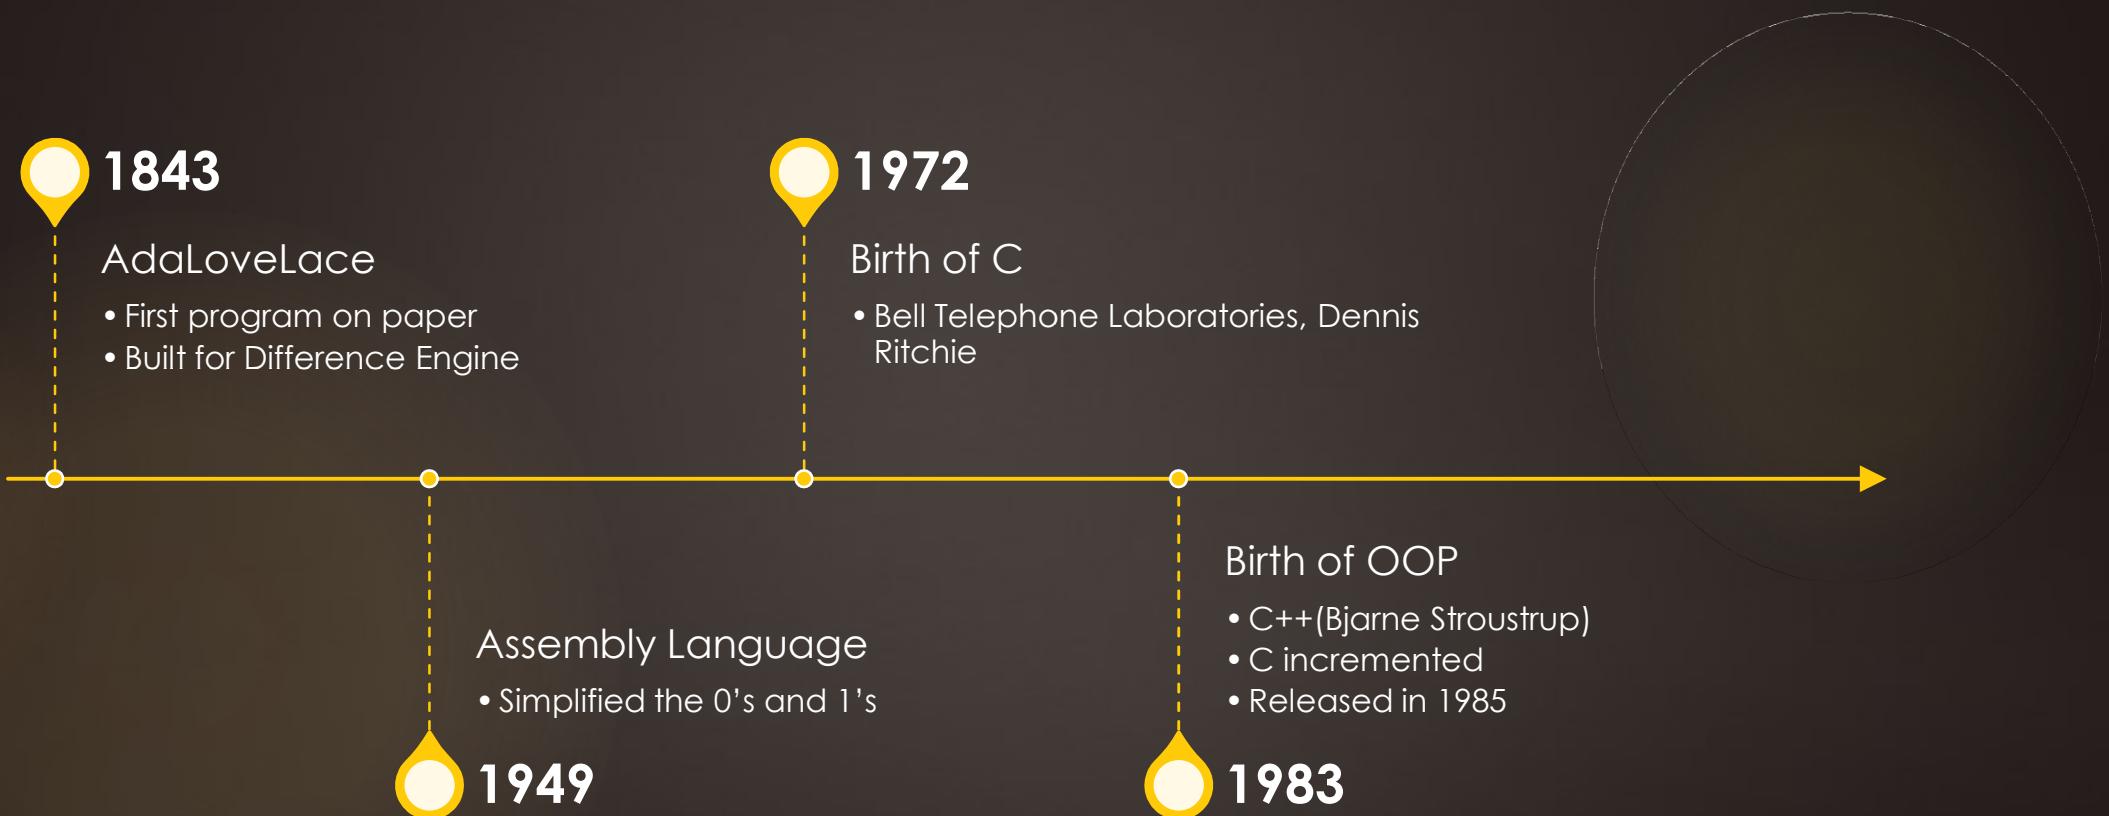

- ▶ Which Language Translator you think is fast?
- ▶ Which Language Translator are you going to use for the course?

What happens when things go wrong?

- Programmers being humans make errors
- There are two main types of errors
 - **Syntax Errors**
 - Grammatical rules of Language are violated
 - Easy to identify
 - **Logical Errors**
 - Human Error, Program will not perform what it is desired to do
 - Like giving the sign of addition when actually wanted to perform subtraction

History of C++

What is C++

C++ is a cross-platform, object oriented language that can be used to create high-performance applications.

C++ is used in developing browsers, operating systems, and applications, as well as in-game programming,

- ▶ For writing C++ Programs we need a Code Editor and Compiler
- ▶ “**A software that provides programming environment to facilitate programmers in writing and executing a computer programs is known as IDE.**”
- ▶ An IDE has Graphical user interface and it helps the programmers, in writing, executing and testing a computer program
- ▶ Visual Studio, Xcode and DevC++ are some famous IDE for C++ Language

Installing DevC++

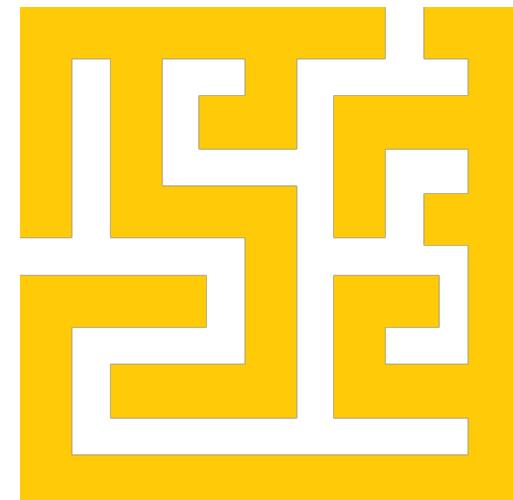

olya's 4 Steps of Problem Solving

Problem Solving Phase

- ▶ U – Understand the Problem
- ▶ D – Devise a Good Plan to Solve

Implementation Phase

- ▶ I – Implement the Plan
- ▶ E – Evaluate the Solution

algorithm

- ▶ A sequence of precise instructions which leads to a solution is called an **algorithm**.

- ▶ Some approximately equivalent words are *recipe*, *method*, *directions*, *procedure*, and *routine*.

DISPLAY 1.6 An Algorithm

Algorithm that determines how many times a name occurs in a list of names:

1. Get the list of names.
 2. Get the name being checked.
 3. Set a counter to zero.
 4. Do the following for each name on the list:
 Compare the name on the list to the name being checked,
 and if the names are the same, then add one to the counter.
 5. Announce that the answer is the number indicated by the counter.
-

First Program in C++

```
► #include<iostream>
► using namespace std;
► int main(){
    cout<<"Hello World";
    return 0;
}
```

.3.2 Structure of C++ Program

► Structure of C++ Program:

► Format of Writing C++ Program

1.Preprocessor directives
2.Global Declarations
3.Main Function{
Local Declarations
Statements
Comments
}
4.User-Defined Functions

Body of Main

. Preprocessor Directives

Begin with # Symbol like
#include, #define etc

Used to include header
files, like stdio.h, conio.h
etc or to define
constants like #define
max 10

Placed at the top of C++
Program

• Main Function

Special Function, Entry Point
for every C++ Program

Starts the execution of
program

void main(){ } returns
nothing

int main(){return 0;}
returns 0

3. Main Function (Body)

► **Body of Main Function starts after opening curly brackets and ends before closing curly brackets, It may contain:**

- Statements
- Variable Declarations
- Calling of Functions
- Return Statement
- Comments

Features of C++ Language

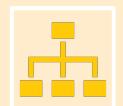

C++ is considered as High level language.

C++ is case sensitive language.

C++ has compiler as a language translator.

C++ is hybrid language (Combination of structured as well as Object orientation paradigm)

Comments

Code statements

- ▶ Ignored by Compiler
- ▶ Not Executed

Add **clarity** to your code

Make your code more **understandable**

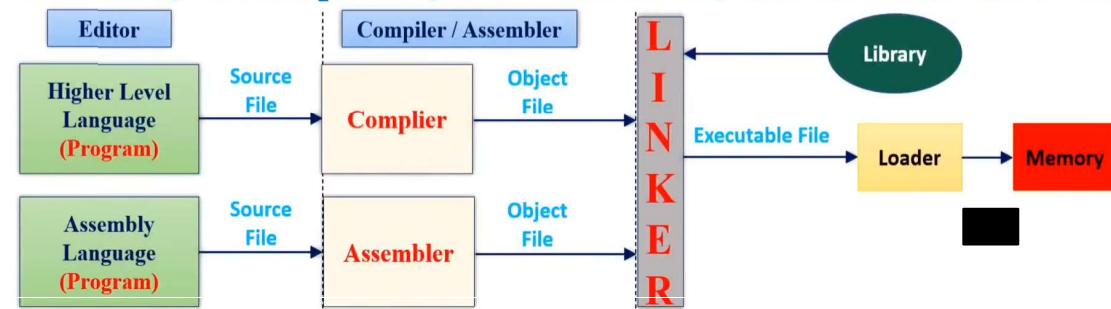

Used for **Documentation** of the Code

Single line vs **Multi-Line Comments**

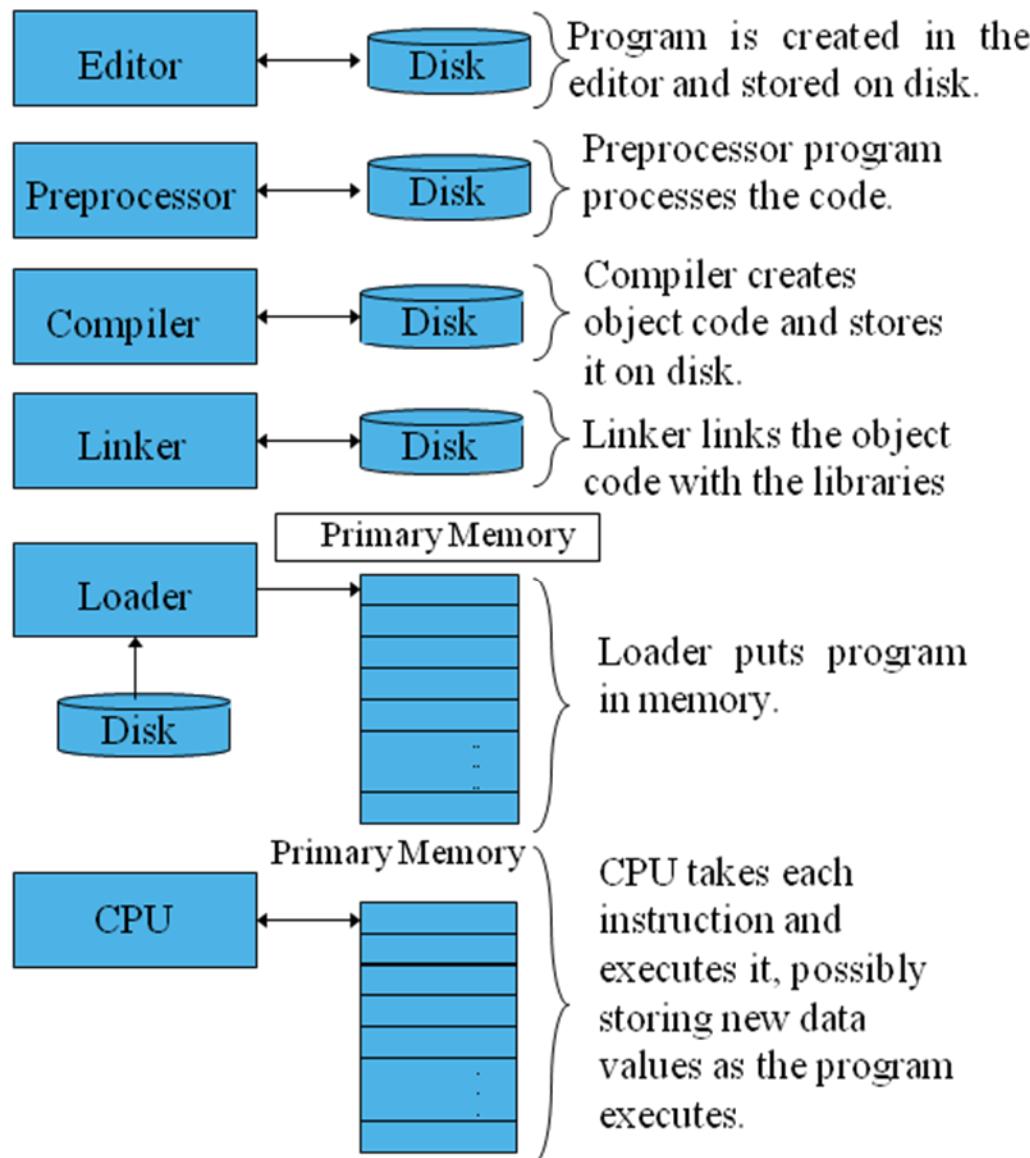

processing
f a C++
rogram

Editor, Compiler, Assembler, Linker & Loader

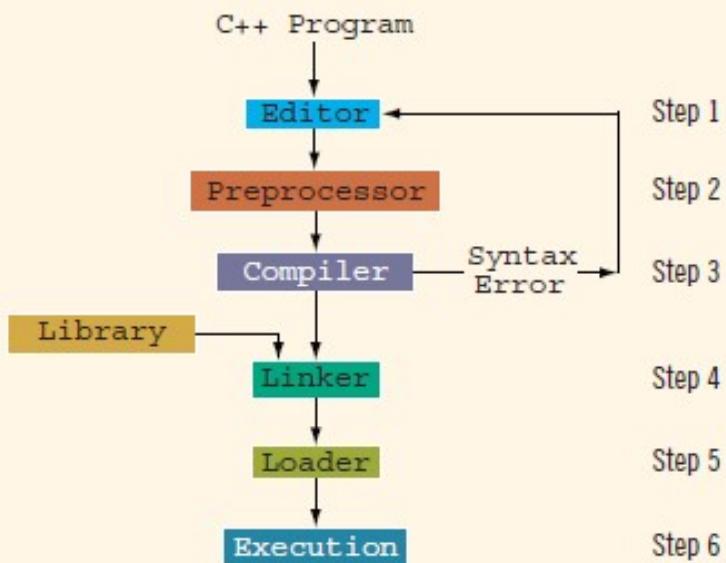

- ❑ In Editor we write programs for Microcontroller.
- ❑ Programs may be written in Assembly Language or Higher Level Language {C Language}.
- ❑ By writing program we generate source file.
- ❑ Assembler : It is used to convert Assembly language into machine code or object file. It also shows errors if any syntax error is there in program.
- ❑ Complier : It is used to convert Higher Level language into machine code or object file. It also shows errors if any syntax error is there in program. It also gives warnings if it is there with programs.
- ❑ Linker : It is linking all the object files of compiler and assembler with the use of library.
- ❑ It will generate executable files.
- ❑ Loader: It is used to load executable files into the memory of microcontroller.
- ❑ Once program is loaded into memory microcontroller can execute it as per the requirement of USER.

Processing of a C++ Program

Processing of a C++ Program

Variables

- ▶ We often use **different types of data**
 - ▶ Variables are used:
 - ▶ To store value for a particular type of data

Variables

- ▶ Each variable in C++ has:
 - ▶ Data Type
 - ▶ Name
 - ▶ Value

Three Actions for Variables

Declaring a Variable:

1. Set the name and data type for a variable
 - a) These two properties don't change

```
Declaring (giving the variable a type)  
number;  
. true_or_false;  
. letter;
```

Three Actions for Variables

Assigning (Initializing) a Variable:

1. Set the value of a variable
 - a) It can change

```
signing (giving the variable a value)
er = 99;
_or_false = true;
er = 'a';
```

Three Actions for Variables

Accessing a Variable:

1. Retrieve the value, by calling it's name.
2. You must declare and assign a variable before you can access it.

```
essing (retrieving the value of the data by printing)  
<<number << endl;  
<< true_or_false << endl;  
<< letter << endl;
```

Characteristics of a Variable

- Variables are changeable
- Variables are container
- Variables are identifier
- Example: a, name, age, salary, x

variable and its values in memory

- Variable: a memory location whose contents can be changed

length

width

area

perimeter

Figure 2-2 Memory allocation

6.0

length

width

area

perimeter

Rules for defining a variable name

A to Z

a to z

Alphanumeric
like a1, day1,
name1 etc

Multiple
characters like
name, fName,
etc.

Can not use
special characters
except '_'
underscore.

Can not be
keywords of
C/C++

xamples

a	Correct
A	Correct
Age	Correct
name	Correct
name1	Correct
first_name	Correct
_age	Correct
first-name	Incorrect
2age	Incorrect
my@age	Incorrect
include	Incorrect
Include	Correct
delay	Incorrect

Reserved words (Keywords) in C++

- ▶ Reserved word symbols (or keywords):
 - ▶ Cannot be redefined within program
 - ▶ Cannot be used for anything other than their intended use

Examples:

- ▶ int
- ▶ float
- ▶ double
- ▶ char
- ▶ const
- ▶ void
- ▶ return

Constants

- Constants are those whose values can not be changed
- Fix in nature
- Example:
 - 92
 - 9.8
 - 3.14

Whitespaces

- ▶ Every C++ program contains whitespaces
 - ▶ Include blanks, tabs, and newline characters
- ▶ Used to separate special symbols, reserved words, and identifiers
- ▶ Proper utilization of whitespaces is important
 - ▶ Can be used to make the program more readable

Data Types

- ▶ Shows the type of Data
- Example:
- 92 (Numeric data)
- 9.8 (Decimal Data)
- A (Character Data)
- Mujtaba (String / Wording Data)

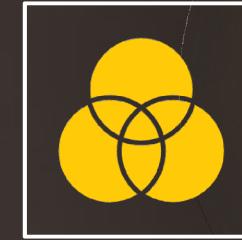

Why different data types?

Data
Representation

Memory
efficiency

Different operations
and functions
(arithmetic on
Integers, Comparison
on Text Values)

Data Types

C++ data types fall into three categories:

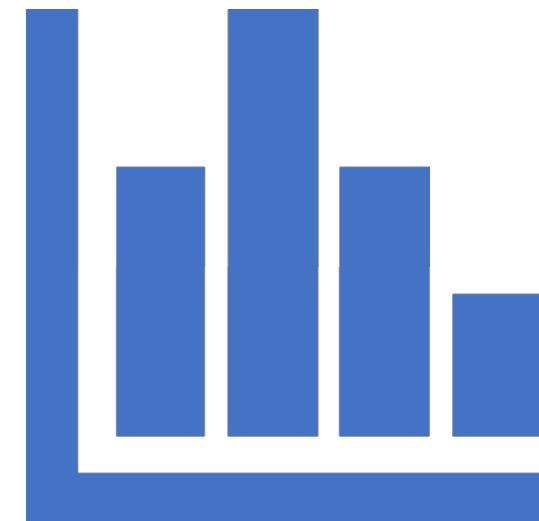

- ▶ Simple data type
- ▶ Structured data type
- ▶ Pointers

Simple Data Types

There are four simple data types in C / C++.

- Countable data types
- Measurable data types
- Character data types
- String data types

Countable Data Types

- unsigned short
- signed short
- unsigned integer
- signed integer
- unsigned long long
- signed long long

Countable Data Types

```
1 #include <iostream>
2 #include <climits>
3 using namespace std ;
4 int main ()
5 {
6     cout << "\n\n Check the upper and lower limits of integer :\n";
7     cout << "-----\n";
8     cout << " The maximum limit of int data type : " << INT_MAX << endl;
9     cout << " The minimum limit of int data type : " << INT_MIN << endl;
10    cout << " The maximum limit of unsigned int data type : " << UINT_MAX << endl;
11    cout << " The maximum limit of long long data type : " << LLONG_MAX << endl;
12    cout << " The minimum limit of long long data type : " << LLONG_MIN << endl;
13    cout << " The maximum limit of unsigned long long data type : " << ULLONG_MAX << endl;
14    cout << " The minimum limit of short data type : " << SHRT_MIN << endl;
15    cout << " The maximum limit of short data type : " << SHRT_MAX << endl;
16    cout << " The maximum limit of unsigned short data type : " << USHRT_MAX << endl;
17    cout << endl;
18    return 0 ;
19 }
20
21 |
```

Countable Data Types

```
Check the upper and lower limits of integer :  
-----  
The maximum limit of int data type : 2147483647  
The minimum limit of int data type : -2147483648  
The maximum limit of unsigned int data type : 4294967295  
The maximum limit of long long data type : 9223372036854775807  
The minimum limit of long long data type : -9223372036854775808  
The maximum limit of unsigned long long data type : 18446744073709551615  
The minimum limit of short data type : -32768  
The maximum limit of short data type : 32767  
The maximum limit of unsigned short data type : 65535  
  
-----  
Process exited after 0.08577 seconds with return value 0  
Press any key to continue . . .
```

```
#include <iostream>
using namespace std ;
int main ()
{
    short s1 = 10 ;
    signed short s2 = 20 ;
    unsigned short s3 = 30 ;
    int i1 = 10 ;
    signed int i2 = 20 ;
    unsigned int i3 = 30 ;
    long l1 = 10 ;
    signed long l2 = 20 ;
    unsigned long l3 = 30 ;
    long long l11 = 10 ;
    signed long long l12 = 20 ;
    unsigned long long l13 = 30 ;
    cout <<"The s1 size in memory = " <<sizeof (s1) <<endl;
    cout <<"The s2 size in memory = " <<sizeof (s2) <<endl;
    cout <<"The s3 size in memory = " <<sizeof (s3) <<endl;
    cout <<"The i1 size in memory = " <<sizeof (i1) <<endl;
    cout <<"The i2 size in memory = " <<sizeof (i2) <<endl;
    cout <<"The i3 size in memory = " <<sizeof (i3) <<endl;
    cout <<"The l1 size in memory = " <<sizeof (l1) <<endl;
    cout <<"The l2 size in memory = " <<sizeof (l2) <<endl;
    cout <<"The l3 size in memory = " <<sizeof (l3) <<endl;
    cout <<"The l11 size in memory = " <<sizeof (l11) <<endl;
    cout <<"The l12 size in memory = " <<sizeof (l12) <<endl;
    cout <<"The l13 size in memory = " <<sizeof (l13) <<endl;
}
return 0 ;
```

The s1 size in memory = 2
The s2 size in memory = 2
The s3 size in memory = 2
The i1 size in memory = 4
The i2 size in memory = 4
The i3 size in memory = 4
The l1 size in memory = 4
The l2 size in memory = 4
The l3 size in memory = 4
The l11 size in memory = 8
The l12 size in memory = 8
The l13 size in memory = 8

Measurable Data Types

- float
- double
- long double

Measurable Data Types

```
1 #include <iostream>
2 #include <cfloat>
3 using namespace std ;
4 int main ()
5 {
6     float f = 9.9 ;
7     double d = 9.9 ;
8     long double ld = 9.9 ;
9     cout << "\n\n Check the upper and lower limits of countable datatypes :\n";
10    cout << " The minimum limit of float data type : " << FLT_MIN << endl;
11    cout << " The maximum limit of float data type : " << FLT_MAX << endl;
12    cout << " The minimum limit of double data type : " << DBL_MIN << endl;
13    cout << " The maximum limit of double data type : " << DBL_MAX << endl;
14    cout << " The minimum limit of long double data type : " << LDBL_MIN << endl;
15    cout << " The maximum limit of long double data type : " << LDBL_MAX << endl;
16    cout << endl;
17    cout << "\n\n Check the space of memory occupied by countable datatypes :\n";
18    cout << "The f size in memory = " << sizeof (f) << endl;
19    cout << "The d size in memory = " << sizeof (d) << endl;
20    cout << "The ld size in memory = " << sizeof (ld) << endl;
21
22 }
```

Measurable Data Types

Check the upper and lower limits of countable datatypes :

```
The minimum limit of float data type : 1.17549e-038
The maximum limit of float data type : 3.40282e+038
The minimum limit of double data type : 2.22507e-308
The maximum limit of double data type : 1.79769e+308
The minimum limit of long double data type : 3.3621e-4932
The maximum limit of long double data type : 1.18973e+4932
```

Check the space of memory occupied by countable datatypes :

```
The f size in memory = 4
The d size in memory = 8
The ld size in memory = 16
```

Character Datatype

- ▶ Store single character
- ▶ In coding we use **char** for character datatype
- ▶ The value must be enclosed in single quotes (' ')
- ▶ Syntax: **char variable_name = 'Value' ;**
- ▶ Example: **char grade = 'A' ;**
- ▶ Character datatype will take **1 byte** of memory
- ▶ Range of character is **-128 to 127**
- ▶ Range of unsigned character is **255**
- ▶ **CHAR_MIN**
- ▶ **CHAR_MAX**
- ▶ **UCHAR_MAX**

Character Datatype

```
► #include <iostream>
► using namespace std ;
► int main ()
► {
► cout << CHAR_MIN << endl ;
► cout << CHAR_MAX << endl ;
► cout << UCHAR_MAX << endl ;
► char sub1_grade = 'A' , sub2_grade = 'B+' ;
► cout << sub1_grade << endl << sub2_grade << endl ;
► return 0 ;
► }
```

Character Datatype

```
► #include <iostream>
► using namespace std ;
► int main ()
► {
►     char c = 65 ;
►     cout << c << endl ;
►     c = '65' ;
►     cout << c << endl ;
►     c = 200 ;
►     cout << c << endl ;
►     return 0 ;
► }
```

String Datatype

- ▶ Store sequence of characters
- ▶ In coding we use **char []** or **string** for string datatype
- ▶ The value must be enclosed in single quotes (" ")
- ▶ Syntax: char variable_name [size in number] = "Value" ;
- ▶ Example: char std_name = "Ahmad" ;
- ▶ string variable_name = "value" ;
- ▶ string std_name = "Mujtaba" ;
- ▶ Char [**n**] datatype will take **n number of bytes** of memory.
- ▶ String datatype will take **n number of bytes** of memory where **n** represents the number of characters in string.

Character Datatype

- What will be the output of following program?

```
#include <iostream>
using namespace std ;
int main ()
{
char name [10] = "Mujtaba" ;
string name1 = "Mujtaba" ;
cout << name << "\t" << sizeof (name) << endl;
cout << name1 << "\t" << sizeof (name1) << endl;
return 0 ;
```
